Unit 1: Introduction to data

2. Exploratory data analysis

Sta 101 - Fall 2015

Duke University, Department of Statistical Science

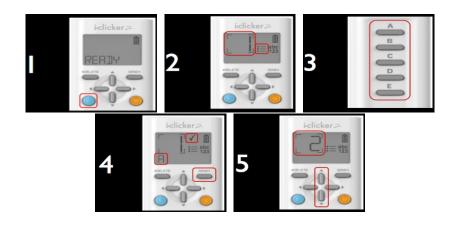

Dr. Çetinkaya-Rundel

Slides posted at http://bit.ly/sta101_f15

Announcements

- ▶ PS 1 is assigned on the course website, start working on it
- ➤ See email / course website for updated TA office hours and start making use of them

► Individual: 15 minutes, using clickers

► Team: 10 minutes, using scratch off sheets (1 per team)

From a past Sta 101 survey...

3

Do you see anything out of the ordinary?

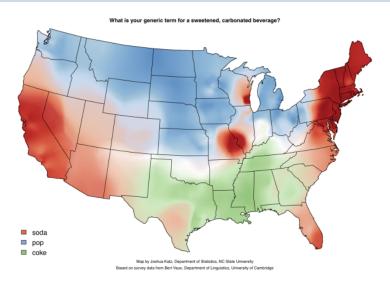

From a past Sta 101 survey...

How are people reporting lower vs. higher values of FB visits?

Describe the spatial distribution of preferred sweetened carbonated beverage drink.

http://spark.rstudio.com/jkatz/SurveyMaps

5

What is missing in this visualization?

Describing distributions of numerical variables

- ► Shape: skewness, modality
- ► Center: an estimate of a typical observation in the distribution (mean, median, mode, etc.)
 - Notation: μ : population mean, \bar{x} : sample mean
- ➤ *Spread*: measure of variability in the distribution (standard deviation, IQR, range, etc.)
- ► Unusual observations: observations that stand out from the rest of the data that may be suspected outliers

6

Clicker question

Which of these is most likely to have a roughly symmetric distribution?

- (a) salaries of a random sample of people from North Carolina
- (b) weights of adult females
- (c) scores on an well-designed exam
- (d) last digits of phone numbers

Clicker question

How do the mean and median of the following two datasets compare?

Dataset 1: 30, 50, 70, 90 Dataset 2: 30, 50, 70, 1000

- (a) $\bar{x}_1 = \bar{x}_2$, $median_1 = median_2$
- (b) $\bar{x}_1 < \bar{x}_2$, $median_1 = median_2$
- (c) $\bar{x}_1 < \bar{x}_2$, $median_1 < median_2$
- (d) $\bar{x}_1 > \bar{x}_2$, $median_1 < median_2$
- (e) $\bar{x}_1 > \bar{x}_2$, $median_1 = median_2$

8

More on SD

Standard deviation and variance

- ▶ Most commonly used measure of variability is the standard deviation, which roughly measures the average deviation from the mean
 - Notation: σ : population standard deviation, s: sample standard deviation
- ► Calculating the standard deviation, for a population (rarely, if ever) and for a sample:

$$\sigma = \sqrt{\frac{\sum_{i=1}^{N} (x_i - \mu)^2}{n}}$$
 $s = \sqrt{\frac{\sum_{i=1}^{n} (x_i - \bar{x})^2}{n - 1}}$

▶ Square of the standard deviation is called the *variance*.

Why divide by n-1 instead of n when calculating the sample standard deviation?

Lose a "degree of freedom" for using an estimate (the sample mean, \bar{x}), in estimating the sample variance/standard deviation.

Why do we use the squared deviation in the calculation of variance?

- ➤ To get rid of negatives so that observations equally distant from the mean are weighed equally.
- ▶ To weigh larger deviations more heavily.

9

11

10

Range and IQR

Clicker question

True / False: The range is always at least as large as the IQR for a given dataset.

- (a) Yes
- **(b)** No

Is the range or the IQR more robust to outliers?

► Mean and standard deviation are easily affected by extreme observations since the value of each data point contributes to their calculation.

Robust statistics

13

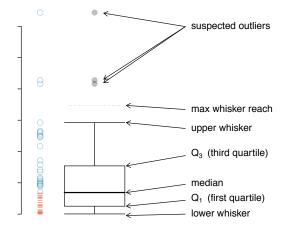

15

- ► Median and IQR are more robust.
- ► Therefore we choose median&IQR (over mean&SD) when describing skewed distributions.

Box plot

12

A box plot visualizes the median, the quartiles, and suspected outliers. An *outlier* is defined as an observation more than $1.5 \times IQR$ away from the quartiles.

Application exercise: 1.1 Distributions of numerical variables

See the course website for instructions.

14

Summary of main ideas

- 1. Always start your exploration with a visualization
- 2. When describing numerical distributions discuss shape, center, spread, and unusual observations
- 3. Robust statistics are not easily affected by outliers and extreme skew
- 4. Use box plots to display quartiles, median, and outliers
